M_M: Mean of the intralaboratory means

s_M: Standard deviation of the intralaboratory means

s_w: Intralaboratory standard deviation

The laboratory mean values have been examined statistically to eliminate outlying values. Where a "----" appears in the table it indicates that an outlying value has been eliminated by either the Cochran or Grubbs Test. Values reported as "less than" by the participating laboratories have not been taken into account in the statistical calculations.

Values given in italics are for information only.

Additional values from laboratories, for information (in µg/g):

The half-width confidence interval C(95%) = $\frac{t \times s_M}{\sqrt{n}}$ where "t" is the appropriate Student's t value and "n" is the number of acceptable mean values

For further information regarding the confidence interval for the certified value see ISO Guide 35:2006 sections 6.1 and 10.5.2

DESCRIPTION OF THE SAMPLE

ECRM 689-1 is available in the form of a powder passing a 250 µm aperture sieve and is supplied in bottles containing 100 g.

INTENDED USE & STABILITY

ECRM 689-1 is intended for the verification of analytical methods, such as those used by the participating laboratories, for the calibration of analytical instruments in cases where the calibration with primary substances (pure metals or stoichiometric compounds) is not possible and for establishing values for secondary reference materials.

It will remain stable provided that the bottle remains sealed and is stored in a cool, dry atmosphere. When the bottle has been opened the lid should be secured immediately after use. If the content should become discoloured (e.g. oxidised) due to atmospheric contamination it should be discarded.

TRACEABILITY

The traceability of ECRM 689-1 has been established in accordance with principles of ISO Guides 30 – 35 and the International vocabulary of basic and general terms in metrology.

The characterisation of this material has been achieved by inter-laboratory study, each laboratory using the method of their choice, details of which are given above. These methods are either stoichiometric analytical techniques or methods which are calibrated against pure metals or stoichiometric compounds. Most methods used were either international or national standard methods or methods which are technically equivalent.
